Dear Trenz,

I think the ability of humans to harness and manipulate electrons is a great way to improve work efficiency and overall life quality. The other important aspect is the problem-solving perspective that comes with electrical engineering, it rewires my brains.

I have accomplished a bachelor's degree of accounting in China, gained some knowledge about finance. And I want to develop myself further, so I started to read some electricity related books, talked with professional people and tried to do some electronic projects* on my own, playing around the circuit, installing solar panels, needless to say, i got totally hooked on it. And I consider myself capable of absorbing the blueprints, schematics, diagrams and implementing cutting-edge energy-efficient solutions fast and precisely. Also I'm able to master hands-on skills for installing, repairing and maintaining the electrical system.

The society needs this important skill, and I'm trying to be useful to other people, so I want to be one part of it. And I believe school is where to learn and improve skills the most and also where to

meet like-minded people, learn from each other and create something more efficient and beneficial to the society.

Sincerely yours,

Stella Vir
